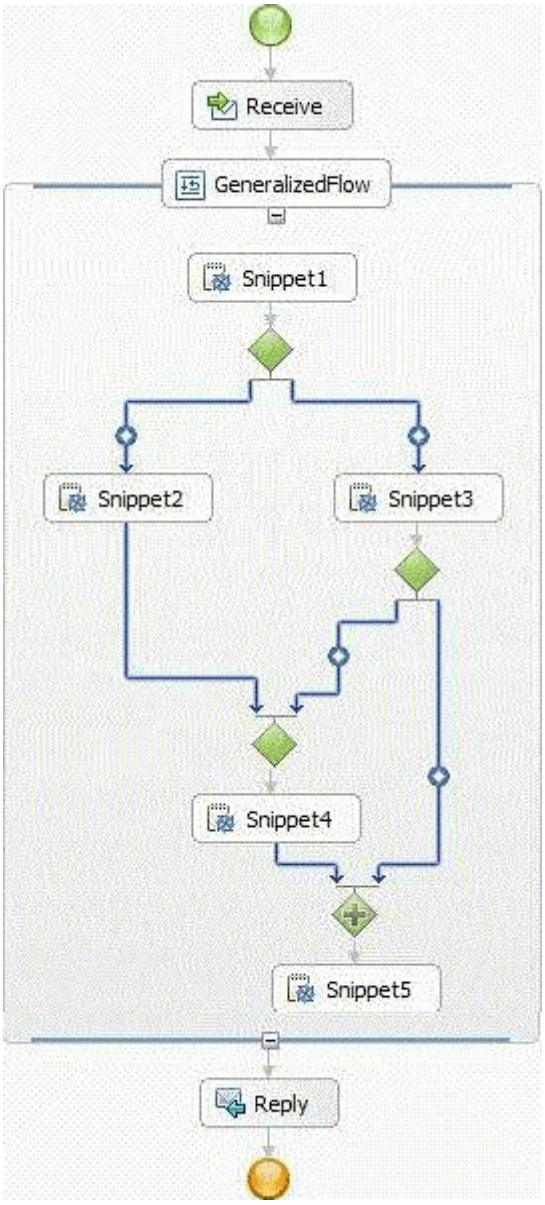
Title : IBM Business Process Manager Advanced V8.0 Integration Development

Version : DEMO

1.An integration developer has configured a BPEL business process for a customer, as shown below:



What behavior will the integration developer observe when executing the flow?

A. It is possible for both Snippet2 and Snippet3 to execute.

B. The execution order of the links entering Snippet2 and Snippet3 has no impact on the process flow.

C. The gateway leading into Snippet5 will cause an error because there is a deadlock in the process flow.

D. The gateway leading into Snippet4 will cause an error because the link exiting Snippet2 has no condition.

Answer: C

2.An integration developer registers two Process Centers with each other and needs to share a child toolkit 'TK-Child' while preserving the dependency with its parent toolkit 'TK-Parent'.

How should a integration developer accomplish this? Set Snapshot status of:

A. TK-Child to 'New' and share it with other Process Centers

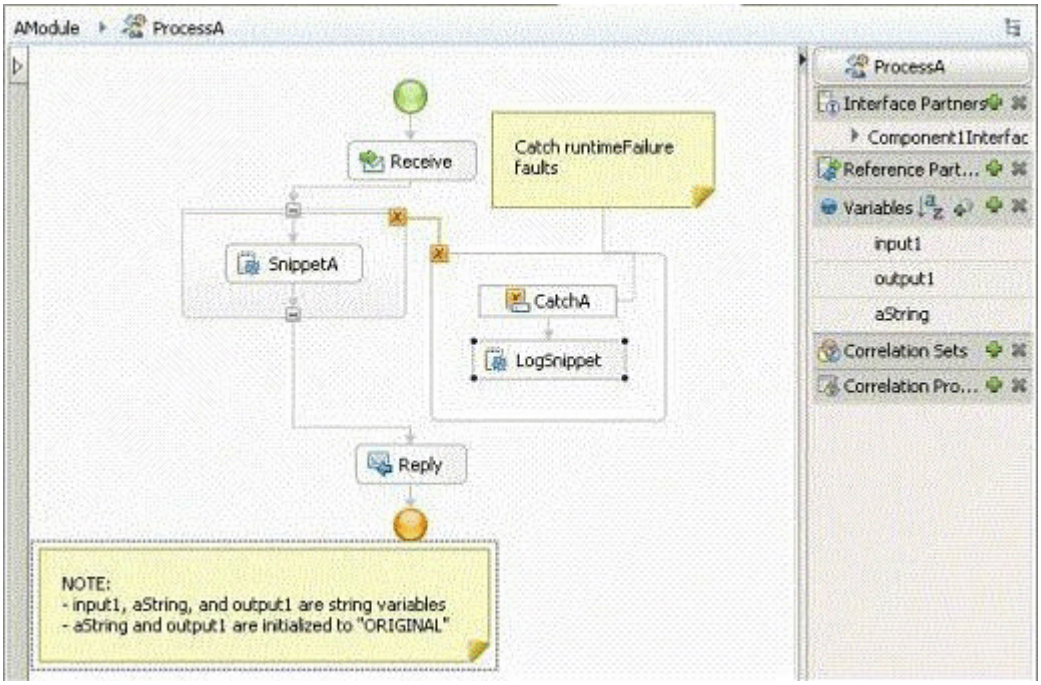
B. TK-Child to 'Released' and share it with other Process Centers

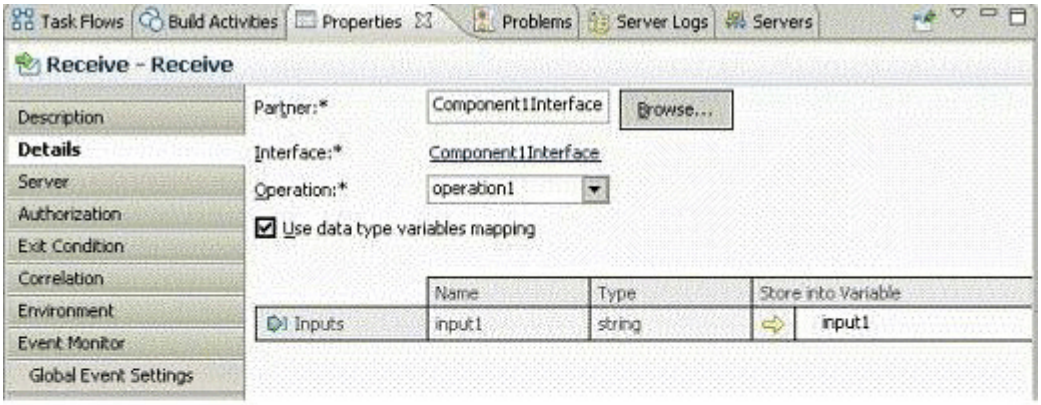
C. TK-Parent to 'Released', TK-Child to 'New' and share both toolkits with other Process Centers

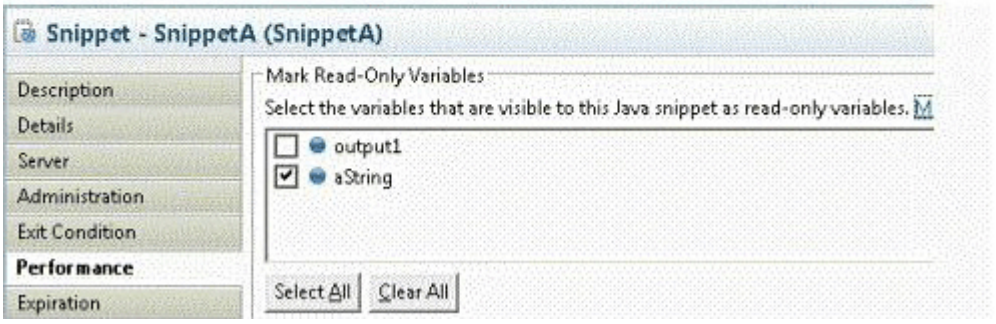
D. TK-Parent to 'Released', TK-Child to 'Released' and share both toolkits with other Process Centers
Answer: D

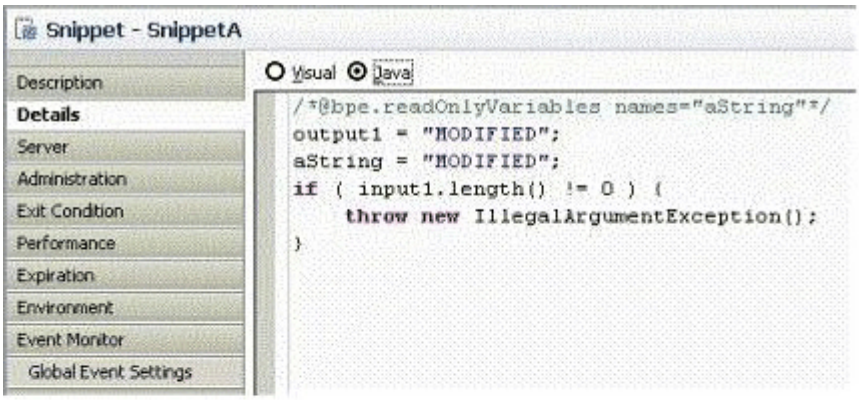
3.A client requires that a new BPEL process return a fault message to the requester in case the process does not complete correctly. The integration developer has added a fault handler to the process to catch all exceptions.
How should the integration developer return the fault message?
A. Use a throw activity of a business fault.
B. Use a reply activity using a standard fault.
C. Use a reply activity using a business fault defined in the interface.
D. Use a rethrow activity in the fault handler on the process scope using a fault defined in the interface.
Answer: C

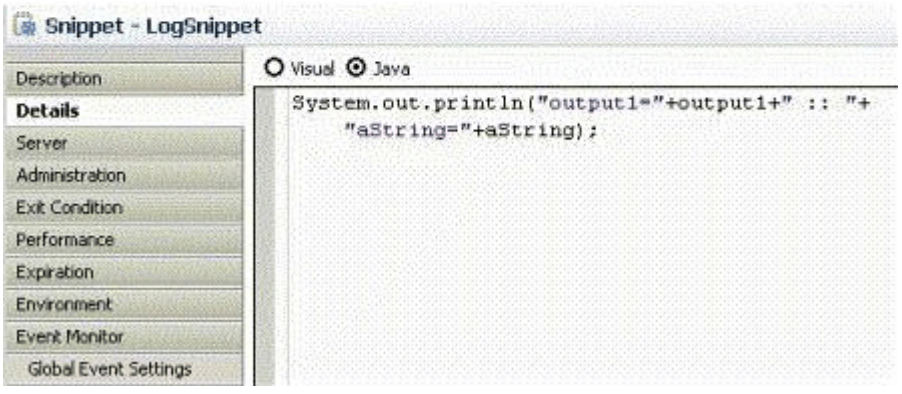
4.An integration developer has implemented the business process shown in the exhibits below.











If the integration developer starts an instance of the ProcessA process with an input of "HELLO", which of the following strings will the LogSnippet snippet write to System.out?

A. output1=ORIGINAL :: aString=ORIGINAL

B. output1=ORIGINAL :: aString=MODIFIED

C. output1=MODIFIED :: aString=ORIGINAL

D. output1=MODIFIED :: aString=MODIFIED

Answer: C

5.An integration developer is planning to create a BPEL process to help with the management of customer requests. The developer is intending to use a short-running process for the implementation because it has been determined that the performance of the process is a high priority, but the process must also be able to compensate for changes to the customer's request.
What approach should the integration developer take while implementing this process?
A. Implement the short-running process as planned, but call the appropriate compensation activity from a fault handler in the process.
B. Implement the short-running process as planned, but associate an undo-operation with the appropriate invoke activity in the process.
C. Since compensation is not supported in short-running processes, implement a long-running process using compensation pairs.
D. Since compensation is not supported in short-running processes, use a compensation handler and a compensation pair together in the
log-running process
Answer: B
