**Title : IBM InfoSphere Guardium
Technical Mastery Test v2**

Version : DEMO

1.What is CAS?

- A. An agent installed on the database server that reports to the collector whenever a monitored entity, such as a file, environment variable or script output has changed.
- B. An agent installed on the database server that reports to the collector whenever a monitored database's version has changed through upgrades or patch installs.
- C. An optional agent installed on the collector that monitors the database server for entity changes.
- D. An agent that acts as the main component of the Central Audit System.

Answer: A

2.Which of the following problems is the Application User Translation feature designed to help with?

- A. The use of non-English parameter values in SQL statements issued by some applications.
- B. The fact that there is no easy way for the application server to communicate with both Guardium and the data server concurrently.
- C. The inability to relate a database action to a specific application user when a pool of database connections is used by an application.
- D. Translating an application's requests made to a data server so these are compatible with all the database management systems that Guardium supports.

Answer: C

3.How would a DBA or developer notify Guardium using the Application User API that an application user has taken or given up control of a data server connection?

- A. By importing the GuardUtils library and issuing calls through it from the application.
- B. By creating a wrapper solution that sends HTTP requests to Guardium's service-oriented API whenever an event like this happens.
- C. By registering the application's connection pool with Guardium.
- D. By using the GuardAppUser call in the form of a SQL SELECT statement to indicate that a new application user has taken control of the connection.

Answer: D

4.Which of the following native SQL commands is required to link external data to internal data?

- A. IMPORT
- B. JOIN
- C. ALTER
- D. LINK

Answer: B

5.What is a Guardium vulnerability assessment (VA)?

- A. A test that employs state-of-the-art algorithms to determine the potential risks of your network.
- B. A series of predefined and custom tests that allow customers to automatically identify and address database vulnerabilities.
- C. An optional service from Guardium where a security specialist visits a customer's site before a proof-of-concept engagement to determine the customer's specific requirements.
- D. A piece of software distributed as a multi-platform plug-in that allows a supported database management system to constantly monitor potential threats and report on these periodically.

Answer: B
